

SIP PRI

Breathe new life into existing equipment.

Convert legacy telecom service into a VoIP phone service without changing existing telecom infrastructure. Additionally, businesses can take advantage of VoIP technology benefits without replacing equipment. Bring your telecom equipment into the future without all the hassle.

Features

Circuits & Hardware

Traditionally, PRIs rely on physical termination hardware or circuits. With SIP PRI, the number of available trunks is a function of available bandwidth.

Scale & Growth

SIP PRI scales up or down easily and quickly (via a software configuration change) and can offer automatic and on-demand burst capabilities.

Backup & Redundancy

Automatic IP rerouting capabilities provide practical geographic distribution of PSTN connectivity to sites with limited or network redundancy.

Disaster Recovery & Business Continuity

The technology allows for automatic call rerouting to predefined locations in the event that the location goes offline.

Key Benefits

Easy Upgrade

Uses SIP Trunking service to provide connectivity to traditional PBXs with PRI interface and/or analog lines.

Easy Management

MetTel's complimentary communications management platform puts the control in your hands.

Savings

MetTel's powerful relationships with the nation's leading carriers allows us to deliver the most competitive long distance and international rates on the market.

UC Ready

Get more out of your SIP PRI by adding MetTel's Unified Communications to your business.
